

All Strut Lights Installation Instructions:

Black to Black.

Red/Yellow to Brown (= RIGHT turn), or Purple (= LEFT turn).

Blue wire (if you have 3 wires running to your stock turn signals) is the running light. To add this function to our lights you will need our wire adaptors. **These can be found only on our website.** Follow the instructions that come in that kit.

Tech Tip:

To help prevent smashing the wires we recommend either A) placing a washer between the rear fender and the backside of the strut, or B) drilling a small hole through the rear fender at the very end of the strut-- NOT THROUGH THE STRUT-- only through the fender where our strut light will cover so you will not see the hole. Be sure to cover the wires with shrink tubing and remove all sharp edges on drilled hole. Run our strut light wire through that hole and begin to follow above wire chart.
